

Robot mower yard assessment

Map the lawn before comparing machines.

Record what you measure. Copy model requirements separately; leave unknowns blank.

Yard / date	Supplier / full mower model
-------------	-----------------------------

01 Sketch every lawn section and the route between them

Label lawn areas A, B and C. Mark gates, steps, trees, beds, slopes and water.

Sketch: include proposed dock, power and areas to exclude

A path or closed gate may separate lawns. Confirm how the mower will reach each area.

02 Measure your yard

Lawn A (m2)	Lawn B (m2)	Lawn C / total (m2)
Narrowest passage + location (cm)		Steepest lawn / boundary slope (%)
Grass variety / desired height (mm)		Available mowing hours / days

Slope (%) = vertical rise / horizontal run x 100, using the same units.

20 cm rise over 100 cm horizontal run = 20%, not 20 degrees. Avoid unsafe access.

03 Copy the exact model requirements

Navigation / signal requirements	Capacity (m2) + schedule assumptions
Passage width / edge setbacks (cm)	Slope limits: inside / boundary (%)
Cutting height range (mm)	Manual version / page / date checked

04 Resolve installation, safety and ownership

Dock / power / drainage / barriers / children, pets and wildlife:

Installed cost / blades / battery / subscriptions / local service:

Unresolved checks / who will confirm: _____

Planning record only. Not installation or safety approval.
